Information systems among companies, especially minmarket have a very important role for the people who are requesting the service, because the goods urgently needed by people to satisfy their daily needs.

Minimarket is one company that is engaged in trade is providing day-to-day needs of the goods, at a mini can be extracted various kinds of information from data sales and purchases of goods, information can be used in organizing the mini-party goods sales system, so that it makes minimarket waiter in calculating profits. In addition minimarket parties shall take full stock of certain goods which are in the minimarket.

To improve the performance of managers is not enough to rely on manual tools, while public demand for increased technology. Not only that, the handling of a transaction lags drug sales grew less accurate because of the frequent calculation errors, data search is very time-consuming goods.

To find the necessary needs in developing the software, by analyzing needs, users and facilities. Based on the analysis, hence designed a software that can handle data processing of goods. This software tool was built with Borland Delphi (7.0) as the display interface design and MySQL as its database of media processing.

Based on the results of research can be concluded that have succeeded in creating software that can assist in data processing of goods, so that can yield an information which accurate enough.
