Employee's system of application is a modern computer application that used to managing employees data. The Goal of Research is built a Employee's system of application that can handle complex and much data in order to more effective and efficient, specially for Badan Kepegawaian Daerah(BKD) Kota Bandung. BKD's have difficult job, cause it have to manage data for more than nineteen thousand and six hundred five PNSs with a dynamic data condition .if administration data management still use conventional way course BKD's performance become not optimal.

The main concept in designing and developing this applications is basic on server client, so we hope this aplications can help all of part of management in BKD of Bandung more integrated one another .

From analysis result and process Implementations this Applications capable to saving and updating employees data, printed reporting of employees data, Processing warning for managing increasing priodictable salaries mutation and warning for managing employee's perodictable position.
