Garut District has the potential of diverse, both potential livestock, agriculture and industry. In an effort to develop the potential of this region, technological approach in obtaining the information is still lacking.

Under this approach the potential of information technology areas are expected to be accepted by more optimally by the community at large, and potentially regional development can be planned well. This condition can be overcome by the Geographic Information System (GIS) that can provide the data attributes of an object map and spatial data.

The role of GIS in the development potential can be used as a tool taking action against a potential area for further development. GIS is presented with a web-based on this design can also be used as a tool to provide information to the public.
