ABSTRACK

Advances in technology now have developed rapidly. Along with these developments, the need for data processing, which accurately and quickly began to be felt by various organizations. One begins to feel those needs are local public service agency of Gorontalo Regency Dr. MM Dunda Hospital. In conducting medical record data processing, Dr. MM Dunda Hospital still use the way by recording into registration book and pieces of medical record. it can slow the process of medical service,and it is necessary for an integrated information system in data processing so that information is produced more quickly and precisely so that services to patients will be better.

The design of this hospital information systems is made with using descriptive qualitative research method approach, while for system development method, the writer is using the "Classic Life Cycle" or better known as the waterfall. For software which is used, the writer uses Visual Basic 6.0, Crystal Reports and SQL Server 2000.

With an integrated information system, all data processing can be done quickly and precisely because of the integration of data between the one with the other parts. hospital information systems that have been made to improve the performance of patient treatment where the data processing system capable of patient registration, registration of inpatients, the pharmacy, the cashier, in an integrated manner so that medical services for hospital patients get better.
