ABSTRACT

Mr.Clean is one of washing service business in the area Jatinangor - Sumedang. This company has been running for about a year and is experiencing growth in its business. Based on this research, that the management system that is running on Mr.Clean still run it manually by using a journal books on the consumer data processing, personnel, raw material calculations, transactions, capital calculation, and calculation of net income and gross, making it less effective and efficient because there is no media in an integrated data processing and will allow the redundant data.

The method used is waterfall method is both a method of system development, when the stage is running there is a lack in the previous stage to do the addition or improvement at this stage of the problem and we can know the point where the stage is problematic. The software for the design and implementation using ASP.NET as a Web server, MySQL as the database and Visual Studio 2010 as an editor writing codings ASP.NET, JavaScript and HTML.

Given the intranet-based information system created is expected to ease in processing, archiving, delivery of information to employees on Mr.Clean, as well as having a more integrated media storage. Moreover, it can be an interactive media and alternative media in the presentation of online information among employees, managers and staff involved.
