By seen the development of e-commerce in Indonesia that keep up, the bussiness development not only focus on phsyic market but can be on internet too. Trade sector that enough significant for development now that use e-commerce is ***CLOTHES MARKETING ORDER AND DELIVERY ONLINE IN GLOBAL SHOP****. That thing is caused this official workshop is very needed by spare part provider for vehicle.But sometime when customer come to this workshop, clothes is not include. In this workshop, e-commerce can be used to expand the transaction network, ease of paid, and can be the information media to promote the clothes in this shop. Not only that, this workshop have some problems in make report because data were only developed in one computer.Depend on that problem, this workshop needs an application that can solve all the problems.*

Information system of clothes marketing base on e-commerce is developed to solve that problem. This system have ability to develop category data, product data, order data, configuration data, sending data, user data, and print the report. This system is hoped that can solve all the problems. Methodology of software development that used is waterfall methodology. This methodology is done several steps to develop a software, for some example are engineering system, system analysis, system design, system implemntation, system testing, and system maintenance. After all the steps is done, the application can be created.

After compare between target of software development with result of system testing then taken some conclusion that software that built have produced water status correctness and have display that user-friendly.
