The continued development of the business will further enhance the development of the emergence of various companies, both trading companies and service companies. This will cause the level of the tight competition, so it takes a professional attitude in managing the company's management, one of which is inventory management. Inventories of goods is one of a very important activity for the development of the company. Inventory problem is a problem that always faced the decision makers in the field of supply due to an irregular pattern of demand.

In this process, it takes the role of procurement in order to meet the demand for goods and services in accordance with the quality, quantity, time, place, price and source the right. In obtaining goods and services, a company requires suppliers or vendors as providers of goods and services. That requires a computerized system. The development of technology enables the implementation of the procurement of goods and services through electronic media or online.

E-procurement applications have been made according to user expectations, both from the ease of use of the system, the procurement of data processing and reporting. The application is already running but not close enough to the maximum possible error can occur when used, so that required maintenance process further.

Keywords: online, uptodate, e-procurement, maintenance.
