ABSTRACT

Office of Communication and Informatics in the process of asset data reception areas experiencing difficulties in obtaining speed information and limited access. Therefore it is necessary to build an information system that can handle these problems. So access to data assets required areas no longer have constraints in terms of limited data access and speed in acquiring local assets that needed. Method of research prototypes as well as a method of system development, when the current stage there is a lack of stage previous additions or repairs can be done directly without having completed the final stage first. The software used is Windows XP SP2 as an operating system, Apache as web server, MySQL as database and Macromedia Dreamweaver 8 as a layout editor and writing PHP files and HTML. Paperless information system built regional office assets are expected to maximize the performance of data processing assets in the region as needed and facilitate the Office of Communications and Information Technology in obtaining information about local assets required.
