ABSTRACT

Balai Pengobatan Sumber Medika is the institution serve serve of prosperity inhabitants. There are limitation in data processing of medical patient and medicine of the system walking only using storage file. To be able to finish the problems faced at institution its trouble shooting is by developing information system medicinal patient. Information system medicinal patient including data processing, the activities introduction patient, medical record, information medicine and report patient.

The activities undertaken and the researchers obtain information medicine, information patient and report patient data Sumber Medika at clinic, as process undertaken.to develop a Information system medicinal patient by using the prototype method and design conducted by make flowmap, data flow diagram(DFD), while modeling data isdescribed by ERD.

After passing through the stages of implementation of the result obtained that data security more secure because it is equipped with user validation. Very fast information about patient, medical record ,medicine data, in the report preparation time needed is shorter than ever before. The fact shows that the user interface enriched approach provides operationl easiners.

Keyword :Information system, medical record, patient and medicine.
