CV. Saswco Perdana is a garment company that have a large amount of data. The process to analyse those data need considerable amount of time. In order to make analyzing process easier, it would need a container which can accommodate those data before processed. The best solution for that problems is data warehouse.

Data warehouse to be constructed will use two-layer architecture. Data warehouse scheme that used is snowflake. There are three fact table, sales, receive, and return. Furthermore, there are three dimensional table, item, date, and shop.

After comparing the goals of developing data warehouse with the results of testing of the system, then we can drawn some conclusions that data warehouse has been built can produce sufficiently accurate information and assist in the analysis process.
