Moist Clothing is a trading company that provides a form of teenage clothing items at this time the results of its own production. Moist Clothing which has had many customers both inside and outside the city of Bandung city has problems, among others, is still applying shopping procedure manuals or customer must immediately come into the store, recording the sales transaction data and data changes are still using manual systems.

By looking at the issues contained in the Moist Clothing, Clothing Moist then the media wants a sales-based website that is expected to help to smooth the process of selling a product that is being executed. The method of analysis used in the construction of e-commerce website Moist Clothing in Bandung based on structured data that is using flowmap and tools used is ERD (Entity Relationship Diagram) to illustrate data model and DFD (Data Flow Diagram) to depict functional model. While the programming language used to create this program is to a database using PHP and MySQL with the assistance of tools Adobe Dreamweaver and WAMP.

Based on the results of negligent and beta testing, the facilities available in applications built with security features Security Socket Layer, and for security in data processing system is also equipped with a Backup and Restore database, testing the system to generate information concluded that the overall system run according expected

Keywords: e-commerce, selling system, Backup and Restore database
