ABSTRACK

Personnel information system is a system used for the storage and data processing personnel, in support of operational personnel. With the development seiringnya Science and Technology, the need for increasing the current information as well as in increasing the company's performance in managing information. But in this case the implementation of information systems personnel in the Office of Communications and Informatics was still having some problems, such as in the case of data processing letters, attendance, and payroll. Therefore the author intends to raise the issue as the title of thesis
Personnel information system THE DEPARTMENT OF COMMUNICATION AND INFORMATION

In this study, the authors used research method is descriptive method with a case study on the staffing and to design information systems using structured approaches and methods for the development use prototype method

Based on the results of the study authors, can be in the know that the personnel information system pasa Office of Communications and Information Technology is currently still experiencing problems, dikarnakan there are some data processing which are conventional, and still have not integrated these data with employee data such as sub-activities payroll data, mail data, and so forth. This leads to less optimal because of the way of information processing in use today and time is needed to meet all information needs for a long time. In the end I hope with the establishment of a new personnel information system can facilitate the personnel in performing their duties as providers of personnel information.
