ABSTRACT

State Workers Board (BKN) Kanreg III Bandung, is one of government instances that has direct responsibility to the Head of BKN. Kanreg BKN has duty to organize a part of BKN's main duty and function in administration and state workers management, which is the authority still adhere to the government's laws. Based on research that the writer does to the workers division in process of tabulation, the promotion data in system that are operating especially in regular, there are still manual and archive forming. Moreover, it does not use application software specially, so that in searching workers data it will spend the time any longer. Therefore, the aims of this research are to know the system that is working, make a designing, and testing from the information system that will be made. After that, the implementation of application program will be made agree with the requirement at the time. Therefore, the result of this research can overcome the problems, tabulation data be accurate, fast and on time.

Research methodology that the writer used in this research is descriptive method, by doing tabulation method of data primer; observation and directly interview to the person involved. In this information system designing, the writer used method structured in approach system, whereas in development system the writer used waterfall method. The instrument that used in system designing are flow map, Context Diagram, DFD, Dictionary of data, ERD, and Normalization. In addition, software that used in this information system is Java Neat beans IDE 6.7. Moreover, as programming language and storage media (database) the writer used MySql and iReport 3.7.5 as reporting output and supporting by windows XP sp 2 in operations.

Result of the research that the writer has done, by operating system in tabulation process of promotion regular that are still manual, it can be the base of suggestion to design system based on chronology event at that time. Do such a trial system of promotion regular to assure quality and to know the weakness of wrong input that is constrained. After came out from the software-error (information system of regular promotion), it can be implemented in workers-sub division in helping tabulation data of Regular promotion.

Key Word : Information System, Promotion.
