Job vacancy websites is one of the most frequently opened websites by Indonesian people. It is caused by skyrocketing job seekers in Indonesia. But, most job vacancy websites set high tariff for companies that are going to advertise job vacancy. Beside that, the majority of job vacancy websites only provide information of job vacancy and apply for a job facility online. Facility that is provided for companies and job seekers in the website are very limited. The users of job vacancy websites do not have effective medias to interact and to build good communication one another. Therefore, they tend to be passive users.

Job Vacancy application based on web was built with HTML (Hypertext Markup Language) as text document markup language, PHP (Hypertext Preprocessor) as script and object which were developed to extend HTML capacity, and MySQL as its database support.

Based on the testing, the application that is built can increase the function of job vacancy website overall so that the users become active in using available facility free.

Keywords : Application, Job Vacancy, company, job seeker, apply for a job
