ABSTRACT

Generaly, a good of medical service that implemented in Harapan Sehat clinic is to give the maximum efforts to the patients in effectiveand efficient way. And the purpose of this research is to analize various services and activity happend in the clinic and make attemp to make it better, effective, and efficient. Because efficiency and effectivity can increase the value of the service it self.

The waterfull method is used to design information system, using the DFD, and Flowchart as the tools. Data collecting is taken from the subject using interview, observation, and literal studies. Mean while, software user in the developement of the system are Borland Delphi 7 and Xampp as the database.

The nearly designet system. Is a aperfection from the sistem before hand. The system is capable to incrase user effectivity, minimalize mistakes or error and threat to critical data. Also it can fasten responses to important decrisious, however, the system is still head some update, this system and interface modules.
