ABSTRACT

Information systems in clinical mitra medika bandung partner is an information system that is intended to process data related to the patient in the clinic mitra medika bandung, data processing patient registration, patient medical records, and data retrieval of medication needed by patients. Not optimal processing of these data led to difficulties in finding information about the state of patient data and report generation are not yet adequate. Therefore we need an information system that can support and solve problems.

To optimize the function of public health information system and suppress the errors incurred by the information system is still manual, the author tries to make a computerized system so that the work goes quickly and effectively by taking the title "Medical Information Systems Patient In Clinical Mitra Medika Bandung ". The data collection techniques are observation, interview and book study while system development phase using prototype.

The author hopes that the authors propose a system that can help the administrative staff, physicians and the pharmacy clinics mitra medika in this process the processing of patient data, either from inputting data, search data, by making a report. The author also hopes that this system can be made to improve the performance of users using this application.
