Community health centers, known as Public Health is conducting a functional organization of health services that are comprehensive, integrated, equitable, acceptable and affordable by the community with active participation of the community and use the results of science and appropriate technology. Public Health has a mandatory program that is commonly performed IHC Point every month. To handle eleven healt center in every village and urban in one work area, they have posyandu*'s cadres who will send the result of the data on the number of participants* posyandu *of maternal and child healt participating. From these data will be monitored by a midwife clinic development so as to produce a follow-up evaluations as a benchmark the performance of development activities in the form* posyandu *MSN program (Monitoring the success of Nutrition), LAMM&CH (Local Area Monitoring Maternal and Child Health) is done once a month and monitoring of nutritional status assessment done once a year.*

See the problems that exist in this IHC Point to tag the problem, is necessary to build a web-based information system to facilitate the use of the data submitted to the posyandu *activity centers and midwives in health centers easier to monitoring and evaluation posyandu activities. The software is built using structured modeling method that uses a tool Macromedia Dreamweaver 8 as a display interface design and MySQL as its database processing media.*

Based on the results of testing using black box method for functional, it is error-free syntax. For it can be concluded that have succeeded in making a system that can facilitate.
