CHAPTER IV

CONCLUSION AND SUGGESTION

4.1 Conclusion

According to the discussion above, I can conclude that the translator which actually is not an expert in medical may be confused to translate when they found medical terms. However, the meaning of the word can be understood without open the dictionary by learning the combining form. The medical terms can be analyzed as they are classified into combining form based on the combining-form theory developed by Ingo Plag.

4.2 Suggestion

After doing the analysis, it can be assumed that determining combining form, after all, is not easy as noticed. However, in order to gain understanding about combining form in medical terms more clearly, some steps are suggested to analyze combining form.

The steps may lead the researcher to the fully examination. First, examine the word indicating as the combining form. Learn the lexeme constructing the word whether it has bound root or not. Second, divide it and make a classification from the bound root that constructs the combining form. Next step is to classify it phonologically or phonetically. Then the combining form that is constructed the medical terms can be identified.
