ABSTRACT

Farissa My Studio is a company engaged in the field of photography. The company aims to complement the needs of the community could be world's photography hobby, and so the community can be fotografi.Adapun problem I have found when the study is that all booking activities and transactions are done recording. This of course is still considered less effective because it takes a long time in order invoicing, invoice transaction and sales reports. This of course takes a long time in making closing statements in each harinnya and pentutupan monthly.

Based on this background, the authors conducted this study to design a data management information system in Studio My Studio Farissa. The authors use research methods are qualitative research methods and methods of system development is prototype method and for modeling the system using Structured Methods. In addition, the software that I use in the manufacture of data management systems in the Studio My Studio Farissa is Netbeans 7.0. and databases using MySQL.

With the management information system data on Farissa My Studio is expected to assist in the sale and purchase of data management and in making reports generated can be more accurate, effective and efficient
