ABSTRACT

Putra jaya material shop is a company that produce building materials.The process of registry and control still done in manual ways.Such as the writing of transaction into a note and then archived.The process of searching is also take a lot of time and sometimes the data goes missing,making the information to be inacurate

Therefore,the writer propose a new system of information.The design is using the structured method and prototype developing method.and the data gathering is using observation,documentation,and interview.All of it then implemented in a program using JAVA programming language.

The developing system information is desktop based with client server network system that integrated with the database which are able to store sale and purchase data in a big quantity,this in turn will hopefully fix the problem in the Putra Jaya material shop.
